Write a simple C++ console program that generates a random funny excuse for incomplete homework or assignments. The program should first take the student's name as input from the user. Then, create an array or vector containing at least 10 different excuse messages, where each message includes a placeholder such as {name}. After storing the excuses, the program should randomly select one excuse from the collection and replace the placeholder with the entered student name. Finally, display the generated excuse on the screen. The program should use basic C++ concepts, simple variable names, and beginner-friendly comments to keep the code short, clean, and easy to understand.

C++

```
#include <iostream>
#include <vector>
#include <cstdlib>
#include <ctime>

using namespace std;

int main() {
```
